

Issue: No Gap Filling “Epochs”

Half-hour NEE gaps during the week after grass cutting were gap-filled using NEE values from similar Rg/Tair/VPD conditions within 7/14-day windows that were “blind” to the grass cut dates. **The gap-filling algorithm needs to restrict search windows so that gaps during the “post-cut” epoch are not filled using data from the “pre-cut” epoch, and vice-versa.**
